

Announcements & Such

- Branden is in Chicago all of this week. He'll return next week.
- Administrative Stuff
 - HW #2 will be returned today. Resubs due Thursday (4pm, drop box).
 - ☞ **Please attach your original assignment to your resub!**
 - * See my "HW Tips & Guidelines" Handout. [We're now caught-up.]
 - ☞ **Make sure you have problem #12 from p. 33 of the 4th printing.**
 - It's about the Mayor's election (and the council members).**
- I have posted a handout with solutions to (some of) the lecture problems on logical truth, logical falsity, equivalence, consistency, etc.
- I have also posted a handout on the "short" truth-table method, which we will be going over in lecture sometime very soon.
- Today: Chapter 3, Continued (Truth-Tables and their applications *etc.*)

p	$\sim p$	p	q	$p \& q$	p	q	$p \vee q$
T	⊥	T	T	T	T	T	T
T	⊥	T	⊥	⊥	T	⊥	T
⊥	T	⊥	T	⊥	⊥	T	T
⊥	T	⊥	⊥	⊥	⊥	⊥	⊥

p	q	$p \rightarrow q$	p	q	$p \leftrightarrow q$
T	T	T	T	T	T
T	⊥	⊥	T	⊥	⊥
⊥	T	T	⊥	T	⊥
⊥	⊥	T	⊥	⊥	T

Chapter 3 — An "Internal Justification" of Our Definition of \rightarrow

1. We want a *truth-functional* semantics for \rightarrow . This is a simplifying *idealization*. Truth-functional semantics are the simplest compositional semantics for sentential logic. [A "Newtonian" semantic model.]
 2. Given (1), the *only* way to define \rightarrow is *our* way, since it's the *only* binary truth-function that has the following three essential *logical* properties:
 - (i) *Modus Ponens* [p and ' $p \rightarrow q$ ' \therefore q] is a valid sentential form.
 - (ii) Affirming the consequent [q and ' $p \rightarrow q$ ' \therefore p] is *not* a valid form.
 - (iii) All sentences of the form ' $p \rightarrow p$ ' are logical truths.
- There are *non-truth-functional* semantics for the English conditional.
 - These may be "closer" to the English *meaning* of "if". But, most agree with our semantics for \rightarrow , when it comes to the crucial *logical* properties (i)-(iii). Indeed, our \rightarrow captures *most* of the (intuitive) *logical* properties of "if".
 - This is analogous to our treatment of the English "however" as "&".

Constructing Truth-Tables for LSL Sentences

- With the truth-table definitions of the five connectives in hand, we can now construct truth tables for arbitrary compound LSL statements.
- The procedure for constructing the truth-table of p is as follows:
 1. Determine the number of rows in the truth-table. This is 2^n , where n is the number of atomic sentences in the compound statement p .
 2. The table will have $n + 1$ main columns: n columns for the atomic sentences in p , and one for the truth-values of p itself.
 3. The table will also have some "quasi-columns" — one for each LSL statement occurring in the compound p — which needn't be drawn explicitly, but which go into the determination of p 's truth values.
 4. Place the atomic letters in the left most columns, in alphabetical order from left to right. And, place p in the right most column.
 5. Write in all possible combinations of truth-values for the atomic statements. There are 2^n of these — one for each row of the table.

6. Convention: start on the n th column (farthest down the alphabet) with the pattern $\top \perp \top \perp \dots$ repeated until the column is filled. Then, go $\top \top \perp \perp \dots$ in the $n - 1$ st column, $\top \top \top \top \perp \perp \perp \perp \dots$ in the $n - 2$ nd column, etc..., until the very first column has been completed.

7. Finally, we compute the truth-values of p in each row of the table. Here, we start from the inside-out. We first copy the truth-values of the atoms, then we compute the negations, conjunctions, etc. which compose p . Finally, we will be in a position to compute the value of the main connective of p , at which point we'll be done with the table.

- Example: Step-By-Step Truth-Table Construction of ' $A \leftrightarrow (B \& A)$.'

A	B	$A \leftrightarrow (B \& A)$
\top	\top	\top
\top	\perp	\perp
\perp	\top	\perp
\perp	\perp	\perp

Logical Truth, Logical Falsity, and Contingency: Definitions

- A statement is said to be **logically true** (or **tautologous**) if it is \top on all interpretations. *E.g.*, any statement of the form $p \leftrightarrow p$ is tautological.

p	$p \leftrightarrow p$
\top	\top
\perp	\top

- A statement is **logically false** (or **self-contradictory**) if it is \perp on all interpretations. *E.g.*, any statement of the form $p \& \sim p$ is logically false:

p	$p \& \sim p$
\top	\perp
\perp	\perp

- A statement is **contingent** if it is *neither* tautologous *nor* self-contradictory. Example: ' A ' (or *any* basic sentence) is contingent.

A
\top
\perp

Logical Truth, Logical Falsity, and Contingency: Problems

- Classify the following statements as logically true (tautologous), logically false (self-contradictory), or contingent:

- $N \rightarrow (N \rightarrow N)$
- $(G \rightarrow G) \rightarrow G$
- $(S \rightarrow R) \& (S \& \sim R)$
- $((E \rightarrow F) \rightarrow F) \rightarrow E$
- $(M \rightarrow P) \vee (P \rightarrow M)$
- $[(Q \rightarrow P) \& (\sim Q \rightarrow R)] \& \sim (P \vee R)$
- $[(H \rightarrow N) \& (T \rightarrow N)] \rightarrow [(H \vee T) \rightarrow N]$
- $[(F \vee E) \& (G \vee H)] \leftrightarrow [(G \vee E) \vee (F \& H)]$

Equivalence, Contradictoriness, Consistency, and Inconsistency

- Statements p and q are **equivalent** [$p \models q$] if they have the same truth-value on all interpretations. For instance, ' $A \rightarrow B$ ' and ' $\sim A \vee B$ '.

A	B	$A \rightarrow B$	$\sim A \vee B$
\top	\top	\top	\top
\top	\perp	\perp	\perp
\perp	\top	\top	\top
\perp	\perp	\top	\top

- Statements p and q are **contradictory** [$p \models \sim q$] if they have opposite truth-values on all interpretations. For instance, ' $A \rightarrow B$ ' and ' $A \& \sim B$ '.

A	B	$A \rightarrow B$	$A \& \sim B$
\top	\top	\top	\perp
\top	\perp	\perp	\top
\perp	\top	\top	\perp
\perp	\perp	\top	\perp

- Statements p and q are **inconsistent** [$p \models \sim q$] if there is no interpretation on which they are both true. For instance, ' $A \leftrightarrow B$ ' and ' $A \& \sim B$ ' are inconsistent [Note: they are *not* contradictory!].

A	B	$A \leftrightarrow B$	$A \& \sim B$
T	T	T	F
T	F	F	T
F	T	F	F
F	F	T	F

- Statements p and q are **consistent** [$p \not\models \sim q$] if there's an interpretation on which they are both true. E.g., ' $A \& B$ ' and ' $A \vee B$ ' are consistent:

A	B	$A \& B$	$A \vee B$
T	T	T	T
T	F	F	T
F	T	F	T
F	F	F	F

Equivalence, Contradictoriness, etc.: Some Problems

- Use truth-tables to determine whether the following pairs of statements are semantically equivalent, contradictory, consistent, or inconsistent.
 - ' $F \& M$ ' and ' $\sim(F \vee M)$ '
 - ' $R \vee \sim S$ ' and ' $S \& \sim R$ '
 - ' $H \leftrightarrow \sim G$ ' and ' $(G \& H) \vee (\sim G \& \sim H)$ '
 - ' $N \& (A \vee \sim E)$ ' and ' $\sim A \& (E \vee \sim N)$ '
 - ' $W \leftrightarrow (B \& T)$ ' and ' $W \& (T \rightarrow \sim B)$ '
 - ' $R \& (Q \vee S)$ ' and ' $(S \vee R) \& (Q \vee R)$ '
 - ' $Z \& (C \leftrightarrow P)$ ' and ' $C \leftrightarrow (Z \& \sim P)$ '
 - ' $Q \rightarrow \sim(K \vee F)$ ' and ' $(K \& Q) \vee (F \& Q)$ '

Semantic Equivalence, Contradictoriness, etc.: Relationships

- What are the logical relationships between ' p and q are equivalent', ' p and q are consistent', ' p and q are contradictory', and ' p and q are inconsistent'? That is, which of these entails which (and which don't)?

Equivalent	Contradictory
\downarrow ? \uparrow	\downarrow ? \uparrow
Consistent	Inconsistent

- Answers:
 - Equivalent \Rightarrow Consistent (example?)
 - Consistent \Rightarrow Equivalent (example?)
 - Contradictory \Rightarrow Inconsistent (why?)
 - Inconsistent \Rightarrow Contradictory (example?)

Semantic Equivalence: Example #1

- Recall that ' p unless q ' translates in LSL as ' $\sim q \rightarrow p$ '.
- We've said that we can also translate ' p unless q ' as ' $p \vee q$ '.
- This is because ' $\sim q \rightarrow p$ ' is *semantically equivalent* to ' $p \vee q$ '. We may demonstrate this, using the following joint truth-table.

p	q	$\sim q$	\rightarrow	p	$p \vee q$
T	T	F	T	T	T
T	F	T	T	T	T
F	T	F	F	F	T
F	F	T	T	F	F

- The truth-tables of ' $p \vee q$ ' and ' $\sim q \rightarrow p$ ' are the same.
- Thus, $\sim q \rightarrow p \models p \vee q$.

Semantic Equivalence: Example #2

- ' $p \leftrightarrow q$ ' is an *abbreviation* for ' $(p \rightarrow q) \& (q \rightarrow p)$ '.
- The following truth-table shows it is a *legitimate* abbreviation:

p	q	$(p \rightarrow q)$	$\&$	$(q \rightarrow p)$	$p \leftrightarrow q$
T	T	T	T	T	T
T	F	F	F	T	F
F	T	T	F	F	F
F	F	T	T	T	T

- ' $p \leftrightarrow q$ ' and ' $(p \rightarrow q) \& (q \rightarrow p)$ ' have the same truth-table.
- Thus, $p \leftrightarrow q \models (p \rightarrow q) \& (q \rightarrow p)$.

Semantic Equivalence: Example #3

- Intuitively, the truth-conditions for *exclusive or* (\oplus) are such that ' $p \oplus q$ ' is true if and only if *exactly* one of p or q is true.
- I said that we could say something equivalent to this using our \vee , $\&$, and \sim . Specifically, I said $p \oplus q \models (p \vee q) \& \sim(p \& q)$.
- The following truth-table shows that this is correct:

p	q	$(p \vee q)$	$\&$	$\sim(p \& q)$	$p \oplus q$
T	T	T	F	F	F
T	F	T	T	T	T
F	T	T	T	T	T
F	F	F	F	T	F

- ' $p \oplus q$ ' and ' $(p \vee q) \& \sim(p \& q)$ ' have the same truth-table.

Some More Semantic Equivalences

- Here is a simultaneous truth-table which establishes that

$$A \leftrightarrow B \models (A \& B) \vee (\sim A \& \sim B)$$

A	B	$A \leftrightarrow B$	$(A \& B)$	\vee	$(\sim A \& \sim B)$
T	T	T	T	T	F
T	F	F	F	F	T
F	T	F	F	F	T
F	F	T	F	T	F

- Can you prove the following equivalences with truth-tables?
 - $\sim(A \& B) \models \sim A \vee \sim B$
 - $\sim(A \vee B) \models \sim A \& \sim B$
 - $A \models (A \& B) \vee (A \& \sim B)$
 - $A \models A \& (B \rightarrow B)$
 - $A \models A \vee (B \& \sim B)$

A More Complicated Equivalence (Distributivity)

- The following simultaneous truth-table establishes that

$$p \& (q \vee r) \models (p \& q) \vee (p \& r)$$

p	q	r	$p \& (q \vee r)$	$(p \& q) \vee (p \& r)$
T	T	T	T	T
T	T	F	T	T
T	F	T	T	T
T	F	F	F	F
F	T	T	F	F
F	T	F	F	F
F	F	T	F	F
F	F	F	F	F

- This is *distributivity* of $\&$ over \vee . It also works for \vee over $\&$.

The Exhaustive Truth-Table Method for Testing Validity

- Remember, an argument is **valid** if it is *impossible* for its premises to be true while its conclusion is false. Let p_1, \dots, p_n be the premises of a LSL argument, and let q be the conclusion of the argument. Then, we have:

$$\begin{array}{c} p_1 \\ \vdots \\ p_n \\ \hline \therefore q \end{array}$$
 is valid if and only if there is no row in the simultaneous truth-table of p_1, \dots, p_n , and q which looks like the following:

atoms		premises		conclusion	
\dots	p_1	\dots	p_n	q	
\dots	\top	\top	\top	\perp	

- We will use simultaneous truth-tables to prove validities and invalidities. For example, consider the following valid argument:

atoms		premises			conclusion
A	B	A	\rightarrow	B	B
\top	\top	\top	\top	\top	\top
\top	\perp	\top	\perp	\perp	\perp
\perp	\top	\perp	\top	\top	\top
\perp	\perp	\perp	\perp	\perp	\perp

☞ VALID — there is no row in which A and $A \rightarrow B$ are both \top , but B is \perp .

- In general, we'll use the following procedure for evaluating arguments:
 - Translate and symbolize the the argument (if given in English).
 - Write out the symbolized argument (as above).
 - Draw a simultaneous truth-table for the symbolized argument, outlining the columns representing the premises and conclusion.
 - Is there a row of the table in which all premises are \top but the conclusion is \perp ? If so, the argument is invalid; if not, it's valid.
- We will practice this on examples. But, first, a “short-cut” method.
