Branden Fitelson Philosophy 57 Lecture

# Philosophy 57 — Day 8

- I will return quiz #2 on Tuesday
- There is no quiz on Tuesday (Quiz #3 is on the following Tuesday 3/04/03)
- Back to Chapter 4 Categorical Statements
  - Brief Review of Terminology
  - Quality, Quantity, and Distribution of Categorical Statements
  - Venn Diagram Representations of Categorical Statements
  - Using Venn Diagram's to Study Simple Arguments
  - The Square of Opposition
  - Conversion, Obversion, and Contraposition
  - Later: Translating from English into Categorical Logic
  - **NOTE**: Sections 4.5–4.6 *skipped* (no Aristotelian stuff)

# Chapter 4: Categorical Statements — Quality, Quantity & Distribution I

- The quality of a categorical claim is either affirmative or negative, depending on whether it *affirms* or *denies* class membership.
  - \* "All S are P" and "Some S are P" have affirmative quality.
  - \* "No S are P" and "Some S are not P" have negative quality.
- The quantity of a categorical claim is either universal or particular, depending on whether it makes a claim about *every* member or just *some* member of *S*.
  - \* "All S are P" and "No S are P" are universal.
  - \* "Some S are P" and "Some S are not P" are particular.
- A term *X* is distributed in a categorical statement if the statement asserts something about *every* member of the class *X* (otherwise, *X* is *un*distributed).
  - \* S is distributed in "All S are P" and "No S are P".
  - \* *P* is distributed in "No *S* are *P*" and "Some *S* are not *P*".
- Remember: Universals distribute Subjects. Negatives distribute Predicates.

Chapter 4: Categorical Statements — Definition & Components

Philosophy 57 Lecture

- A categorical statement (or proposition) relates two classes or categories, denoted by the subject term (S) and the predicate term (P). Categorical statements assert that either all or part of S is included in (excluded from) P.
- Categorical statements come in four standard forms:
  - (A) All S are P. (E) No S are P.
  - (I) Some S are P. (O) Some S are not P.
- The words "all", "no" and "some" are called quantifiers.
- The words "are" and "are not" are called the copula.

**Example.** All members of the American Medical Association are persons holding degrees from recognized academic institutions.

\* quantifier = "all," S = "members of the AMA," P = "persons holding degrees from recognized academic institutions," copula = "are".

## Chapter 4: Categorical Statements — Quality, Quantity & Distribution II

Proposition	Name	Quantity	Quality	S	P
All $S$ are $P$ .	Α	Universal	Affirmative	Distributed	Undistributed
No $S$ are $P$ .	E	Universal	Negative	Distributed	Distributed
Some $S$ are $P$ .	I	Particular	Affirmative	Undistributed	Undistributed
Some $S$ are not $P$ .	0	Particular	Negative	Undistributed	Distributed

• It may help to simply *memorize* the cases of distribution. The text offers two mnemonic devices for remembering the above facts about distribution.

Mnemonic #1. Unprepared Students Never Pass.

Universals distribute Subjects. Negatives distribute Predicates.

Mnemonic #2. Any Student Earning B's Is Not On Probation.

A distributes Subject. E distributes Both.

I distributes Neither. O distributes Predicate.

• I prefer to *deduce* these using Venn Diagrams and the *definition* of distribution. In Logic, answers can always be *deduced* from basic definitions.

SJSU Philosophy Chapter 4, Cont'd 02/20/03

Chapter 4: Categorical Statements — Venn Diagrams & The Square of Opposition II

containing two overlapping circles. The box stands for "all things", and the

• To represent categorical statements using Venn Diagrams, we draw a box

#### Chapter 4: Categorical Statements — Venn Diagrams & The Square of Opposition I

- Ultimately, we will use Venn Diagrams to test categorical arguments (syllogisms) for validity and invalidity. First, we need to learn how to represent categorical statements using Venn Diagrams.
- We will always operate from the *modern*, *Boolean* standpoint. You can ignore the stuff in the book about the traditional, Aristotelain standpoint.
- The standard from categorical statements can be understood as follows:
  - (A) All S are P. = No members of S are outside P.
  - (E) No S are P. = No members of S are inside P.
  - (I) Some S are P. = At least one S exists, and that S is a P.
  - (O) Some S are not P. = At least one S exists, and that S is not a P.
- Note: A and E do *not* imply that any S's exist! This is the modern, Boolean standpoint. On the Aristotelian view, **A** and **E** do imply that some S's exist.
- Consider "All unicorns are one-horned animals" (Boolean vs Aristotelian).

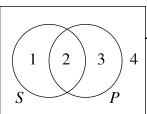

SJSU Philosophy

Chapter 4, Cont'd

02/20/03

two circles stand for the S and P classes in the claim being represented.

The box stands for the class of "all things".

- It is helpful to think about which class of things are contained in each of 1–4.
- Region 1 = the class of things which are inside S but outside P.
  - Region 2 = the class of things which are inside S and inside P.
  - Region 3 = the class of things which are outside S and inside P.
  - Region 4 = the class of things which are outside S and outside P.

### Chapter 4: Categorical Statements — Venn Diagrams & The Square of Opposition III

- Next, we adopt the following two Venn Diagram conventions.
  - 1. If a region (i.e., 1–4) is *empty*, we use *shading* (hashing) to indicate this.
  - 2. If a region contains at least one thing, we use an "X" to indicate this.
- Venn Diagrams for the *particular* claims I and O involve only "X"s:

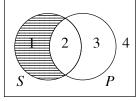

- (I) Some S are P.
- (**O**) Some S are not P.
- It should be clear from these diagrams that the I and O claims say different things. We'll show below that neither claim implies the other.

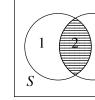

Branden Fitelson

Philosophy 57 Lecture

#### Chapter 4: Categorical Statements — Venn Diagrams & The Square of Opposition IV

• The *universal* **A** and **E** claims require the *shading* (*hashing*) of regions.

(A) All S are P.

- **(E)** No *S* are *P*.
- We can use these 2-circle Venn diagrams to investigate the *logical* relationships between the 4 standard-form categorical claims.
- For instance, we can already determine if the following four simple arguments are valid (Hurley calls these arguments "immediate inferences"):

$$\frac{A}{\therefore O}$$
,  $\frac{A}{\therefore not-O}$ ,  $\frac{E}{\therefore I}$ ,  $\frac{E}{\therefore not-O}$ 

Chapter 4, Cont'd

Chapter 4: Categorical Statements — Venn Diagrams & The Square of Opposition VI

• To draw the Venn diagram for the *denial* of a categorical claim, one marks the

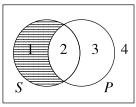

same regions as for the categorical claim itself — but in the opposite ways.

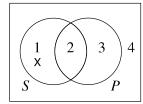

Instead of putting an "X" in a region, one shades it (and vice versa).

• So, the *denial* of an **O** claim would look like this:

#### Chapter 4: Categorical Statements — Venn Diagrams & The Square of Opposition V

- Three steps: (1) Draw the Venn Diagram for the premise, (2) Draw the Venn Diagram for the conclusion, (3) Does the premise-diagram contain the information in conclusion-diagram? If so, then the inference is valid.
- Example:  $\frac{A}{O}$ . Putting the **A** and **O** diagrams side by side, we have:

(**A**) All S are P.

(**O**) Some S are not P.

- We can see that the premise-diagram does not contain the information of the conclusion diagram. So, the argument  $\frac{A}{10}$  is *invalid* ( $A \Rightarrow 0$ ).
- What about the argument from **A** to the *denial* of **O**?

#### Chapter 4: Categorical Statements — Venn Diagrams & The Square of Opposition VII

- We can use the same technique to analyze  $\frac{E}{c.l}$  and  $\frac{E}{c.not-l}$ . Blackboard exercise.
- Let's return to the inference from I to O. Recall, I said that "Some S are P" does *not* imply "Some S are not P". Look at the diagrams again:

(I) Some S are P.

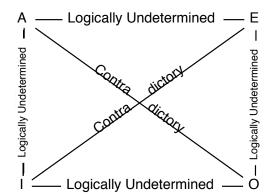

(**O**) Some S are not P.

- The I-diagram does *not* contain the information of the **O**-diagram. So, the argument  $\frac{1}{10}$  is *invalid* ( $\mathbf{I} \Rightarrow \mathbf{O}$ ). "Some S are P"  $\Rightarrow$  "Some S are not P"
- Also:  $\mathbf{I} \Rightarrow not$ - $\mathbf{O}$ ,  $\mathbf{A} \Rightarrow \mathbf{I}$ ,  $\mathbf{A} \Rightarrow not$ - $\mathbf{I}$ ,  $\mathbf{E} \Rightarrow \mathbf{O}$ ,  $\mathbf{E} \Rightarrow not$ - $\mathbf{O}$ . These logical relationships between A, E, I, O are summarized in the Square of Opposition.

Chapter 4: Categorical Statements — Venn Diagrams & The Square of Opposition VIII

*not***–O**: It is *not* the case that some S are not P.

• But, this is just the A-diagram! That is, the A-diagram contains the information in the *not-O*-diagram. Hence,  $\frac{A}{-not-O}$  is valid ( $A \Rightarrow not-O$ ).

- This Square is just a handy way of summarizing the following 12 logical relationships between the four standard form categorical claims:
  - \*  $A \Rightarrow not\text{-}\mathbf{O}, \mathbf{O} \Rightarrow not\text{-}\mathbf{A}, \mathbf{E} \Rightarrow not\text{-}\mathbf{I}, \mathbf{I} \Rightarrow not\text{-}\mathbf{E}, \mathbf{I} \Rightarrow \mathbf{O}, \mathbf{I} \Rightarrow not\text{-}\mathbf{O},$  $A \Rightarrow I$ ,  $A \Rightarrow not-I$ ,  $E \Rightarrow O$ ,  $E \Rightarrow not-O$ ,  $A \Rightarrow E$ ,  $A \Rightarrow not-E$ .

Branden Fitelson Philosophy 57 Lecture 13

#### Chapter 4: Categorical Statements — Conversion, Obversion & Contraposition I

- Conversion, Obversion, and Contraposition are three important operations or transformations that can be performed on categorical statements.
- The Converse of a categorical statement is obtained by switching its subject and predicate terms. This switching process is called Conversion.

Proposition	Name	Converse
All $A$ are $B$ .	Α	All $B$ are $A$ .
No $A$ are $B$ .	E	No $B$ are $A$ .
Some $A$ are $B$ .	I	Some $B$ are $A$ .
Some $A$ are not $B$ .	0	Some $B$ are not $A$ .

- Some statements are *equivalent to* (*i.e.*, *have the same Venn Diagram as*) their converses. Some statements are *not* equivalent to their converses.
- **E** and **I** claims are equivalent to their converses, whereas **A** and **O** claims are *not* equivalent to their converses. Let's *prove* this with Venn Diagrams.

Chapter 4, Cont'd

Branden Fitelson	Philosophy 57 Lecture	15	

SJSU Philosophy

SJSU Philosophy

### Chapter 4: Categorical Statements — Conversion, Obversion & Contraposition III

• The Contrapositive of a categorical statement is obtained by: (1) *converting* the statement, and (2) replacing both the subject term and the predicate term with their complements. This 2-step process is called Contraposition.

Proposition	Name	Contrapositive
All $A$ are $B$ .	Α	All non- <i>B</i> are non- <i>A</i> .
No $A$ are $B$ .	E	No non- $B$ are non- $A$ .
Some $A$ are $B$ .	I	Some non- $B$ are non- $A$ .
Some $A$ are not $B$ .	0	Some non- $B$ are not non- $A$ .

- Some statements are *equivalent to* (*i.e.*, *have the same Venn Diagram as*) their contrapositives. Some statements are *not* equivalent to their contrapositives.
- A and O claims are equivalent to their contrapositives, whereas E and I claims are *not* equivalent to their contrapositives. Let's *prove* this with Venn's.

Chapter 4, Cont'd 02/20/03

Branden Fitelson Philosophy 57 Lecture

#### Chapter 4: Categorical Statements — Conversion, Obversion & Contraposition II

- The complement of a term "X" is written "non-X", and it denotes the class of things *not* contained in the X-class. Do not confuse "not" and "non-". "not" is part of the *copula* "are not", but "non-" is part of a *term* "non-X" ("non-X" can be either the subject term or the predicate term of a categorical statement).
- The Obverse of a categorical statement is obtained by: (1) switching the quality (but *not* the quantity!) of the statement, and (2) replacing the predicate term with its complement. This 2-step process is called Obversion.

Proposition	Name	Obverse
All $A$ are $B$ .	Α	No A are non-B.
No $A$ are $B$ .	E	All A are non-B.
Some $A$ are $B$ .	I	Some <i>A</i> are not non- <i>B</i> .
Some $A$ are not $B$ .	0	Some $A$ are non- $B$ .

• All categorical statements are logically equivalent to their obverses. Let's prove this for each of the four categorical claims, using Venn Diagrams.
