Confirmation Theory (Continued)

- Sad News: David Lewis died suddenly on Sunday evening.
- Administrative: let's talk about paper topics.
- Early (Qualitative) Accounts of Confirmation
 - Hypothetico-Deductivism (re-cap)
 - Instance Confirmation (continued)
 - Classic Constraints on Qualitative Confirmation
 - * EC, SCC, CC, CCC, NTC, ...
- \bullet Problems & Paradoxes for the H-D and Hempelian Accounts
 - Raven Paradox
 - Grue Paradox
 - Other Problematic Cases

The Hypopthetico-Deductive (H-D) Method (Re-Cap)

October 16, 2001

- The general form of a deductive (i.e., H-D) prediction is:
 - H. Hypothesis under test.

Philosophy 164/264

Philosophy 164/264

- K. Background assumptions (initial conditions, etc.).
- E. Observational (deductive) prediction.
- We can also look at the "reverse inference", from the observation E to the hypothesis H (given K). NOTE: this direction is inductive!
 - E. Observational (deductive) prediction.
 - K. Background assumptions (initial conditions, etc.).
 - H. Hypothesis under test.
- Of course, an H-D theorist in *not* claiming that *E conclusively* supports (or even *strongly* supports) *H*, given *K*. They would concede that the support provided by *E* (given *K*) may *not* be strong.
- This is merely a qualitative claim, that E confirms H, relative to K.

Philosophy 164/264 October 16, 2001

The Hypopthetico-Deductive (H-D) Method (Re-Cap)

- What happens if $\sim E$ is observed? Where should we place the *blame*? Why doesn't the $\sim E$ disconfirm K, and leave H unscathed?
- This problem of *locating the blame* in cases of H-D-*disconfirmation* is known as the *Quine-Duhem Problem*. Quine and Duhem both shoed that hypotheses only entail predictions in conjunction with auxiliaries.
- This seems to be an insurmountable problem for the H-D theory. But, in a Bayesian (or probabilistic) account of confirmation, this problem can be addressed (if not overcome) in an interesting way.
- Example: We may have overwhelming (independent) evidence supporting the high accuracy of some test (say, an HIV test). And, although is is highly unlikely (pre-test) that someone has HIV, a positive test result (E) should (in such a case) be viewed as evidence in favor of HIV (H), not as evidence against the accuracy of the test (K).

October 16, 2001

The Hypopthetico-Deductive (H-D) Method (Re-Cap)

- Other Problems with the H-D Theory of Confirmation
 - The Problem of Alternative Hypotheses (underdetermination)
 - * For any (finite) collection of evidence E, there are infinitely many inconsistent hypotheses which (together with K) entail E. The H-D account gives us no way to favor any of these.
 - The Problem of Statistical Hypotheses (non-deductive prediction)
 - * Most (if not all) hypotheses in science are statistical in nature. They do not *entail* observational data (but only *confer a probability on* them).

 H-D (falsely) assumes that all prediction (and testing) is *deductive*.
 - The Problem of Irrelevant Conjunction (tacking problem)
 - * According to H-D, if E confirms H, then E confirms H & X for any X even for irrelevant (or negatively relevant!) X's.
 - The Problem of Quantitative Generalization (degrees of confirmation)

Hempelian "Instance" Confirmation I

- In Hempel's classic "Studies in the Logic of Confirmation" (in reader), he outlines an alternative to H-D (qualitative) confirmation.
- The basic idea (or slogan!) behind this account is:

"Hypotheses are confirmed by their positive instances."

- What this means, precisely, is not so easy to say!
- Before Hempel, Nicod tried to explain the notion of "positive instance" for universal conditionals (H) having the following logical form:

 $H: (\forall x)(Rx \to Bx)$ [e.q., all ravens are black]

- According to Nicod, E is an instance of such an H just in case E satisfies both the antecedent and consequent of H (e.g., Ra & Ba).
- When applied to confirmation, this leads to absurd results . . .

Philosophy 164/264 October 16, 2001

Hempelian "Instance" Confirmation II

 $H': (\forall x)(\sim Bx \rightarrow \sim Rx)$ [e.g., all non-black things are non-ravens]

- According to Nicod, Ra & Ba confirms H but not H'. This is absurd, since H and H' are logically equivalent (they say the same thing)!
- This suggests the following desideratum for accounts of confirmation: Equivalence Condition (EQC). If E confirms H, and H is logically equivalent to $H'(H \Leftrightarrow H')$, then E confirms H'.^a
- Things get even worse for Nicod! Consider the following hypothesis:

$$H'': (\forall x)[(Rx \& \sim Bx) \rightarrow (Px \& \sim Px)]$$

• Nothing can satisfy the consequent of H''. Therefore, on Nicod's account, nothing can confirm H''. But, $H \Leftrightarrow H''$!

^aStrictly speaking, we should always be saying "confirms relative to K", "entails relative to K", etc. But, since all the K's must be the same in these sorts of desiderata (why?). we will just omit the "relative to K"s from their definitions. Don't forget they are there!

Philosophy 164/264

October 16, 2001

Hempelian "Instance" Confirmation III

• After giving-up on Nicod's instance account, Hempel laid down the following desiderata (in addition to the Equivalence Condition).

Entailment Condition (EC). If E entails H, then E confirms H. $\ensuremath{\mathfrak{U}}$ Special Consequence Condition (SCC). If E confirms H, \j\ and H entails H', then E confirms H'.

Consistency Condition (CC). If E confirms H, and Econfirms H', then H and H' are logically consistent. **Non-Triviality Condition** (NTC). For all H, there exists an E

• Because Hempel accepts these desiderata, he *must* reject:

which does *not* confirm H.

Converse Consequence Condition (CCC). If E confirms H, and H' entails H, then E confirms H'.

^aSee Dretske's "Epistemic Operators". SCC claims that confirmation is penetrating.

More on Hempel's Desiderata

- In the new paper topics, I include a question which involves careful analysis and thought concerning these conditions.
- The EQC, the EC, and the NTC all seem quite intuitive.
- The CC is not obvious (as Jeff pointed out last time). Typically, competing theories will not be consistent. Nonetheless, we might think that our evidence confirms both theories — it just confirms one more strongly than the other (we will see examples in Bayesian framework).
- The SCC and the CCC are not as straightforward. I think Dretskean considerations can be raised in connection with SCC. But, giving clear, concrete counterexamples to these principles will require an alternative theory of confirmation — Bayesian confirmation, for instance . . .
- Questions: Is confirmation transitive (if X confirms Y, and Y confirms Z, must X confirm Z)? Is confirmation symmetric (if X confirms Y must Y confirm X)? Which properties (EQC, ...) does H-D have?

Philosophy 164/264

Hempelian "Instance" Confirmation IV

- Hempel then gave an account satisfying his 5 desiderata. The key definition behind his "instance" account is as follows:
- The development of a hypothesis H for a set of individuals I [dev $_I(H)$] is (intuitively) "what H says (extensionally) about the members of I."
- Formally, $dev_I(H)$ is obtained by (i) conjoining all the *I*-instances (in the naive, Nicod sense) of H, if H is a universal (\forall) claim, and (ii) disjoining all the *I*-instances of H, if H is an existential (\exists) claim.
- Examples: Let $I = \{a, b\}$, then we have:
 - If $H = (\forall x)Bx$, then $dev_I(H) = Ba \& Bb$.
 - If $H = (\exists x)Rx$, then $dev_I(H) = Ra \vee Rb$.
 - If $H = (\forall x)(\exists y)Lxy$, then (working from the outside-in):

$$dev_I(H) = (\exists y) Lay \& (\exists y) Lby$$
$$= (Laa \lor Lab) \& (Lba \lor Lbb)$$

Hempelian "Instance" Confirmation V

- Now, we're ready for the definition(s) of *Hempel-confirmation*.
- E directly-Hempel-confirms H, relative to background K, just in case $E \& K \vDash dev_I(H)$ for the class I of individuals mentioned in E.
- E Hempel-confirms H, relative to K, iff E directly-Hempel-confirms (rel. to K) every member of a set of sentences S such that $S \& K \models H$.
- Why the two definitions? Ra & Ba does not directly Hempel-confirm $Rb \to Bb$, but Ra & Ba does Hempel-confirm $Rb \to Bb$ (α -variants).
- Problematic Examples for Hempel's Theory:
 - Let $I = \{a, b\}$, $H = (\forall x)Rxy$, E = Raa & Rab & Rbb & Rba, and E' = Raa & Rab & Rbb. E Hempel-confirms H, but E' does not.
 - No consistent E can confirm the following, which is true on \mathbb{N} , (H) $(\forall x)(\exists y)x < y \& (\forall x)x \nleq x \& (\forall x)(\forall y)(\forall z)[(x < y \& y < z) \to x < z]$ since $\operatorname{dev}_I(H)$ is inconsistent, for any finite I! Prove this!

Hempelian "Instance" Confirmation VI

- Two Deeper, Philosophical Problems with Hempel's Account:
 - Paradox of the Ravens: Consider the hypothesis that all ravens are black, $H: (\forall x)(Rx \to Bx)$. Which of these Hempel-confirms H?

E_1 : $Ra_1 \& Ba_1$	E_2 : $\sim Ra_2$	E_3 : Ba_3
E_4 : $\sim Ra_4 \& \sim Ba_4$	E_5 : $\sim Ra_5 \& Ba_5$	E_6 : $Ra_6 \& \sim Ba_6$

Answer: All but E_6 Hempel-confirm H! Red Herrings confirm H?!

- Goodman's Grue Paradox: Consider the hypothesis that all ravens are "blite", where the predicate "blite" (B) is defined as follows:
 x is blite iff either (i) x is examined before (the end of) today, and x is black or (ii) x is examined after today, and x is white.
 On Hempel's theory, Ra & Ba confirms H. But, this means that a black raven observed today confirms the hypothesis that ravens observed tomorrow (and thereafter) will be white!
- ^aSee Rosenkrantz's "Does the Philosophy of Induction Rest on a Mistake" for insights.

Philosophy 164/264 October 16, 2001 12

Prelude to Probabilistic Accounts of Confirmation

- Historically, there have been two kinds of probabilistic confirmation:
 - 1. **Absolute**: E confirms H (relative to K) if $\Pr(H \mid E \& K) > \tau$, for some "threshold value" τ (*i.e.*, if $\frac{E \& K}{\cdot H}$ is "inductively strong").
 - 2. **Incremental**: E confirms H (rel. to K) if $\Pr(H \mid E \& K) > \Pr(H \mid K)$ (i.e., if E is positively stochastically relevant to H, given K).

Incremental confirmation has become more popular in recent years.

- As we will see, these accounts behave much differently than either H-D or Hempel confirmation (and much differently than each other). For instance, these accounts do not satisfy either SCC or CCC. Moreover, on *neither* of these accounts is confirmation *transitive*. On the incremental (but *not* on the absolute!), confirmation *is symmetric*.
- Before we move on to such issues, we will have to talk a bit more about probability and its interpretation. We will start there next time ...
